Access

Net Brains

Ability to manage Information and Content

Ability to manage information and content

*Total property cost reduction
by:*

- Efficient consolidation of information resources, practices and data administration procedures.
- Effective integration of existing infrastructure
- Optimize access and information search time
- Project saving as an integral part of information management.
- Provide business continuity
- Multiprotocol information delivery

Net Brains, has designed Smart Access based on an analysis of various situations faced by present-day companies to help the increasing demand from business partners, clients and users of information management and content distribution. Smart Access has developed a solution based on a consolidation scheme for data administration resources, practices and procedures which allows the integration of the various company operational sectors (projects, departmental, etc.) to facilitate data handling, decision making and reducing the time and cost implied in developing projects and searching for information.

Besides providing efficient information and content distribution

handling, **SmartAccess**

strengthens the data

administration practices

needed to avoid data

storage redundancy and

maintain high accessibility.

It allows administration

policies and procedures

to be automated, saves

information and optimizes the

increase of storage systems by

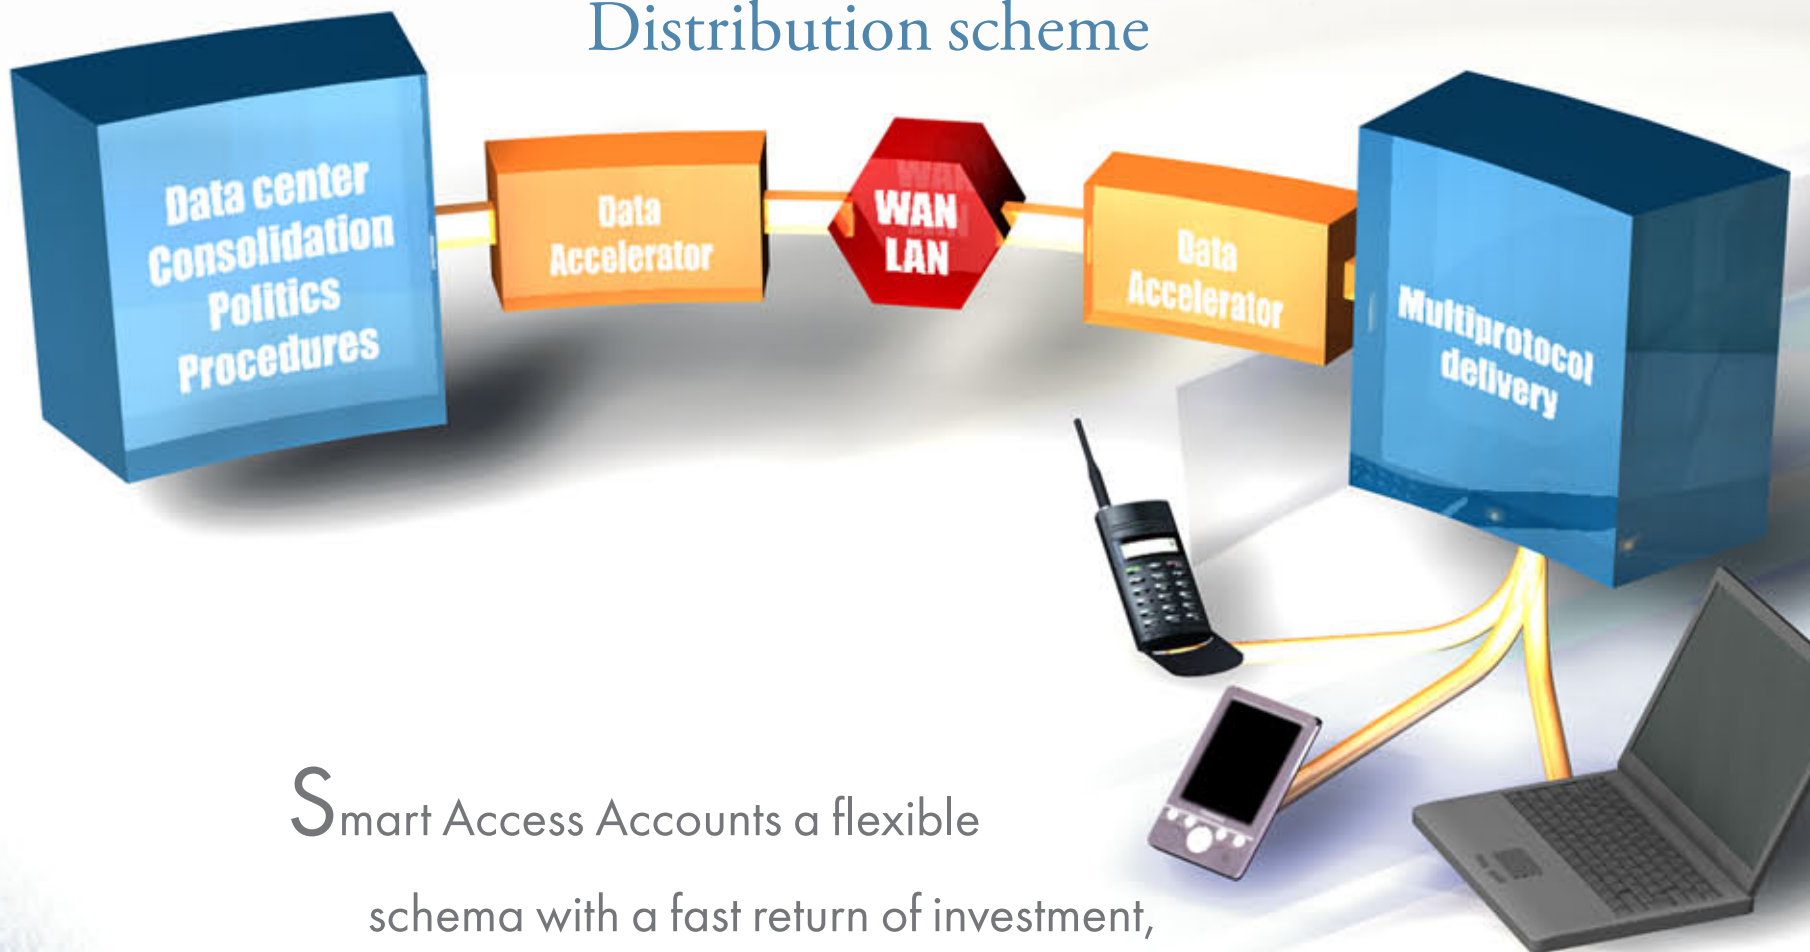

establishing a priority

information handling.

Implementation

Implementation phases

Distribution scheme

Smart Access Accounts a flexible schema with a fast return of investment, through three stages, this can be applied according to the business necessities and economic resources available.

Smart Access solution components

Data center.

Consolidation of information technology resources in the various operational sectors involved, in order to distribute archives, avoid redundancy in data storage and automate the administrative policies and procedures and to save information

Distribution Scheme

Considers the revision, or if necessary, the implementation of the entire communications infrastructure to facilitate swift information delivery and distribution to end-users and /or various remote data centers.

Multi-level delivery.

The client's requirements will be considered when reaching a definition of the most appropriate and efficient information delivery through a wide array of reading or writing devices which might include: personal computers, mobile telephones, etc..

The Smart Access solution consists of the following elements:

Connectivity

Define las características y condiciones para cumplir con la infraestructura de comunicaciones necesaria, garantizando alta disponibilidad y soporte a un ambiente de trabajo exigente.

Application Server and Data Base

Technology storage

The use of NAS and/or SCSI to consolidate information resources for an efficient data protection solution

HSM technology software

adjusts the order in which project data is saved, shifted and stored.

Tape Libraries / CD organization

For near line storage

Approach of a Smart Access solution

Approach of a Smart Access solution

Since this is a technological proposal geared to handle information and content distribution, its applications are specifically addressed to the sectors of the market that generate large volumes of information which need handling, protection and maintenance solutions for information and data.

Industrial and public sectors that would benefit from this solution:

- Energy
- Manufacturing
- Retail
- Government
- Hospitals, among others.
